Preface	xi
1 Applications of the characteristic mode theory to antenna design	1
<i>Ting-Yen Shih and Nader Behdad</i>	
1.1 Introduction	1
1.1.1 Background	1
1.1.2 Characteristic mode theory	1
1.2 Antenna design examples using the characteristic mode theory	6
1.2.1 Circularly polarized antennas	7
1.2.2 Wideband antennas	11
1.2.3 Chassis-based MIMO antennas	12
1.2.4 Bandwidth enhancement of platform-based antennas	15
1.3 Summary	31
References	32
2 Design of antennas mounted on complex platforms using the characteristic mode (CM) and characteristic basis (CB) function methods	35
<i>Raj Mittra, Ashwani Kumar, and Chao Li</i>	
2.1 Introduction	35
2.2 TCM approach to designing antennas for mobile phone platforms	37
2.3 Characteristic basis method for locating antennas on mobile phone platforms	42
2.4 Placement of multiple antennas on a complex platform	45
2.4.1 TCM-based approach	45
2.4.2 CB-based approach	50
2.5 Illustrative examples	52
2.5.1 Four microstrip patch antennas on an FR4 substrate	52
2.5.2 Topside of a ship excited by monopoles	55
2.5.3 Four PIFA antennas on FR4 substrate	57
2.5.4 Chassis excited by six dipoles	58
2.6 Conclusion	62
Acknowledgment	63
Appendix	64
Appendix A1 Characteristic modes and bases	64
A1.1 Generation of characteristic modes (CMs)	64
A1.2 Generation of CBs	64

Appendix A2	73
A2.1 TCM analysis of mobile phone antenna and antenna-plus-platform	73
References	74
3 Wideband L-probe patch antenna	77
<i>Hau Wah Lai and Kwai Man Luk</i>	
3.1 Introduction	77
3.2 Basic characteristics	78
3.2.1 L-probe feeding mechanism	78
3.2.2 M-probe feeding mechanism	83
3.3 Parametric studies	91
3.3.1 Performance with different P_h	91
3.3.2 Performance with different aspect ratio	93
3.4 Development of L-probe and M-probe fed patch antenna	97
3.4.1 Circular polarization	97
3.4.2 Dual polarization	98
3.4.3 Dual band	99
3.4.4 Conformal ground plane	99
3.4.5 Printed circuit board	100
3.4.6 Fusion of the L-probe and M-probe in antenna design	100
3.5 Conclusion	103
References	103
4 Advancements in MIMO antenna systems	109
<i>Mohammad S. Sharawi</i>	
4.1 Introduction	109
4.2 MIMO antenna system performance metrics	110
4.3 Major MIMO antenna system design challenges	115
4.4 MIMO antenna system examples	116
4.4.1 Mobile phones and handheld devices	116
4.4.2 Cognitive radio front-ends	119
4.4.3 USB dongle MIMO implementations	120
4.4.4 Wireless access point MIMO implementations	121
4.5 MIMO antenna solutions for 5G-enabled systems	122
4.5.1 Mobile terminal 5G solutions	122
4.5.2 Base station 5G solutions	122
4.6 Conclusions	123
References	124
5 Reconfigurable leaky-wave antennas	129
<i>Yingjie Jay Guo, Debabrata K. Karmokar, and Trevor S. Bird</i>	
5.1 Introduction	129
5.2 History of LWAs	130
5.2.1 Basic operating principle	130

5.2.2	Classification of LWAs	131
5.3	Passive frequency-scanning LWA structures	132
5.3.1	One-dimensional (1-D) Fabry–Pérot LWA	132
5.3.2	Composite right/left-handed transmission line and LWA	135
5.3.3	Half-width microstrip LWA	137
5.4	Reconfigurable LWAs	138
5.4.1	1-D FP-reconfigurable LWAs	138
5.4.2	Two-dimensional (2-D) FP-reconfigurable LWA	146
5.5	Experimental results	149
5.5.1	CRLH-based reconfigurable LWA	152
5.5.2	Reconfigurable half-width microstrip LWA	156
5.6	Conclusion	167
	References	168
6	Reconfigurable high-gain antennas for wireless communications	171
	<i>Yingjie Jay Guo, Pei-Yuan Qin, and Raj Mittra</i>	
6.1	Introduction	171
6.2	Reconfigurable array antennas	172
6.3	Reconfigurable PRS antennas	182
6.3.1	Frequency-reconfigurable PRS antenna	182
6.3.2	Pattern-reconfigurable PRS antenna	183
6.3.3	Polarization-reconfigurable PRS antenna	189
6.4	Conclusions	197
	References	197
7	Microfluidically reconfigurable antennas	203
	<i>Gokhan Mumcu</i>	
7.1	Introduction	203
7.2	Fabrication and actuation techniques	205
7.3	Flexible and stretchable liquid metal antennas	210
7.4	Frequency-reconfigurable liquid metal antennas	213
7.5	Reconfigurable antennas using dielectric liquids	220
7.6	Beam-steerable liquid metal antennas	224
7.7	Reconfigurable antennas using microfluidically repositionable metallized plates	227
7.8	Concluding remarks	236
	References	237
8	Flexible and wearable antennas	243
	<i>Muhammad M. Tahseen and Ahmed A. Kishk</i>	
8.1	Introduction	243
8.2	Wearable antennas for biomedical applications	246
8.3	AMC-based flexible wearable antennas	247
8.4	Inkjet-printed wearable antennas	249

8.5	Textile-based wearable antennas	250
8.5.1	Single- and multi-layer multi-Bowtie conformal antennas	250
8.5.2	Dielectric resonator antennas for wearable application	253
8.5.3	Wearable artistic antennas for WLAN-band	255
	References	271
9	Wearable technology and mobile platform for wearable antennas for human health monitoring	279
	<i>Vijay K. Varadan, Pratyush Rai, Se Chang Oh, Prashanth Shyam Kumar, Mouli Ramasamy, and Robert E. Harbaugh</i>	
9.1	Introduction	280
9.2	Smart textile for health monitoring	282
9.3	Electrical signals from the brain and heart	286
9.4	Cardiovascular anatomy and electrophysiology	291
9.4.1	The dipole theory for ECG	294
9.4.2	Derivation of ECG from dipole vector	296
9.5	Monitoring and diagnosis: neurological signal measurements	298
9.6	Monitoring and diagnosis: cardiological signal measurements of diagnostic value	302
9.7	Monitoring systems	307
9.8	Neurological disorder monitoring by wearable wireless nano-bio-textile sensors	311
9.9	Cardiovascular health monitoring	327
9.9.1	Hardware system	328
9.9.2	ECG signal acquisition	329
9.10	Biofeedback system for therapeutics	337
9.11	Conclusion	340
	References	341
10	Meta-atoms and artificially engineered materials for antenna applications	351
	<i>Ravi Kumar Arya, Shiyu Zhang, Shaileshachandra Pandey, Ashwani Kumar, Yiannis Vardaxoglou, William Whittow, and Raj Mittra</i>	
10.1	Introduction	351
10.2	Lens designs using MTMs	353
10.3	Lens design using RO	355
10.4	3D-Printing technique	356
10.5	Design of artificially engineered materials	357
10.5.1	Designing higher-permittivity materials from low-permittivity COTS material: method-1	358
10.5.2	Designing higher-permittivity materials from low-permittivity COTS material: method-2	359

10.5.3	Designing lower-permittivity materials from high-permittivity COTS material	360
10.5.4	Designing lower-permittivity materials from high-permittivity 3D-printing material	360
10.6	Different lens designs	362
10.6.1	PLA Lens design	362
10.6.2	DaD lens design	371
10.6.3	ABS lens design	377
10.6.4	Comparison of DaD and ABS lenses	381
10.7	Summary	384
10.8	Metal-only reflectarray antenna designs using metasurfaces	386
10.9	Performance enhancement of antenna and array antennas using metasurface superstrates	394
10.9.1	Example-1	394
10.9.2	Example-2	398
10.9.3	Summary	402
	References	402
11	Microwave antennas based on metamaterials and metasurfaces	407
	<i>Wen Xuan Tang and Tie Jun Cui</i>	
11.1	GRIN MTM lens antennas	408
11.1.1	MTM flat lens antenna	408
11.1.2	MTM curved lens antennas	419
11.2	MTM antennas using transformation optics	425
11.2.1	MTM flattened reflectors	427
11.2.2	MTM flattened convex and hyperbolic lenses	431
11.2.3	MTM Luneburg lens with flattened focal surface	434
11.3	Metasurface antennas	436
11.3.1	Holographic metasurfaces for beam scanning	438
11.3.2	Spoof SPP radiations	438
11.3.3	Coding metasurfaces	439
	References	440
12	Metamaterial-based zero-phase-shift-line loop antennas	445
	<i>Zhi Ning Chen, Xianming Qing, Jin Shi, and Yunjia Zeng</i>	
12.1	Introduction	445
12.2	State-of-the-art ZPSL loop antennas	446
12.3	Modeling of zero-phase-shift-line structure	447
12.3.1	Dispersion analysis of zero-phase-shift-line structure	447
12.3.2	Design guidelines	452
12.4	Design and applications	456
12.4.1	Electrically large zero-phase-shift-line loop antennas for UHF near-field RFID readers	456

12.4.2	Horizontally polarized omnidirectional antenna for WLAN access points	470
12.4.3	CP omnidirectional antenna for UHF far-field RFID readers	472
12.5	Summary	477
	References	478
