Preface	xi
1 Terahertz antennas, metasurfaces and planar devices using graphene	1
<i>Michele Tamagnone, Santiago Capdevila Cascante, and Juan R. Mosig</i>	
1.1 Introduction	1
1.1.1 Graphene	2
1.1.2 Outline	2
1.2 2D materials in the framework of Maxwell's equations	3
1.3 Graphene planar plasmonic antennas	6
1.3.1 Fixed frequency plasmonic antennas	6
1.3.2 Frequency-reconfigurable plasmonic antennas	9
1.3.3 Graphene plasmonic antenna model	11
1.4 Efficiency upper bounds in graphene tunable and non-reciprocal devices	13
1.4.1 Generalized electric and magnetic field representation	14
1.4.2 Demonstration of the upper bound	15
1.4.3 Graphene figure of merit	17
1.4.4 Device specific bounds	19
1.5 Graphene terahertz non-reciprocal isolator	22
1.5.1 Isolator working principle	23
1.5.2 Measurements	24
1.6 Graphene terahertz beam steering reflectarray prototype	27
1.6.1 Working principle	28
1.6.2 Design and measurement	29
1.7 Conclusions	32
Acknowledgments	34
References	34
2 Millimeter-wave antennas using printed-circuit-board and plated-through-hole technologies	39
<i>Kung Bo Ng, Dian Wang, and Chi Hou Chan</i>	
2.1 Wideband MMW ME dipole antennas	40
2.1.1 Single feed printed ME dipole antenna	40
2.1.2 Differential feed printed ME dipole antenna	47
2.2 HOM MMW patch antenna	53
2.2.1 Wideband HOM patch element	53
2.2.2 Differentially fed HOM patch antenna	58

2.3	Wideband MMW complementary source antennas for 5G	62
2.3.1	Linearly polarized antenna fed by an SIW	62
2.3.2	Radiation mechanism of the wideband antenna	63
2.3.3	Comparison of simulation and measurement results	66
2.4	Conclusion	70
	Acknowledgment	71
	References	71
3	THz photoconductive antennas	73
	<i>Mingguang Tuo, Jitao Zhang, and Hao Xin</i>	
3.1	Introduction of THz technology and photoconductive antenna	73
3.1.1	Importance of THz technology	73
3.1.2	THz generation	73
3.1.3	Pulsed THz generation	74
3.1.4	Photoconductive antenna	75
3.1.5	Terahertz time-domain spectroscopy	77
3.2	Theoretical modeling and numerical simulation	78
3.2.1	Motivation and challenge	78
3.2.2	Drude–Lorentz model	79
3.2.3	Equivalent circuit model	81
3.2.4	Full-wave model	83
3.2.5	Simulation examples of full-wave model	87
3.3	Experimental characterization of PCA component and system	95
3.3.1	Far-field THz-TDS	95
3.3.2	THz near-field microscopy	111
3.4	Summary	119
	References	120
4	Optical antennas	127
	<i>Chengjun Zou, Withawat Withayachumnankul, Isabelle Staude, and Christophe Fumeaux</i>	
4.1	Introduction	127
4.2	Early history	128
4.3	Theory and analysis	129
4.3.1	Metal properties from microwave to optical frequencies	129
4.3.2	Plasmonic effects	132
4.3.3	Mie resonances in nanoscale resonators	134
4.3.4	Dielectric resonators versus plasmonic resonators	136
4.4	Nanoantenna fabrication	137
4.4.1	Top-down approaches	137
4.4.2	Bottom-up approaches	140
4.5	Optical characterisation of nanoantennas	140
4.6	Applications	141
4.6.1	Localised field enhancement	141
4.6.2	Sensing	144

4.6.3	Integrated photonics	146
4.6.4	Planar optical components	147
4.6.5	Photodetection	149
4.6.6	Selective thermal emission	150
4.7	Conclusion and outlook	151
	References	152
5	Fundamental bounds and optimization of small antennas	161
	<i>Mats Gustafsson, Marius Cismasu, and Doruk Tayli</i>	
5.1	Introduction	161
5.2	Stored energies and fundamental bounds for antenna analysis and design	162
5.2.1	Stored energies	163
5.2.2	Q_Z computation from current densities	165
5.2.3	Fundamental bounds	167
5.3	Antenna optimization	168
5.3.1	Genetic algorithms	169
5.3.2	Convex optimization	173
5.4	Examples	173
5.4.1	Bent-end simple phone model	173
5.4.2	Bent-end simple phone model—optimization for Q_Z	176
5.4.3	Wireless terminal antenna placement using optimum currents	178
5.5	Conclusions	181
	References	181
6	Fast analysis of active antenna systems following the Deep Integration paradigm	187
	<i>Rob Maaskant</i>	
6.1	Introduction: The Deep Integration paradigm	187
6.1.1	Potential impact and other integration approaches	190
6.1.2	Scientific and technological challenges	191
6.2	Modeling approach and assumptions	191
6.3	The antenna array element	193
6.3.1	Concept	193
6.3.2	Method-of-moments analysis of a folded dipole antenna array	194
6.4	Multiscale numerical analysis of an antenna array	200
6.4.1	The Characteristic Basis Function Method	201
6.4.2	Generation of characteristic basis functions	203
6.4.3	Numerical matrix compression and solution	205
6.4.4	Active versus passive antenna array results	206
6.5	Conclusions	209
	References	210

7 Numerically efficient methods for electromagnetic modeling of antenna radiation and scattering problems	213
<i>Yang Su and Raj Mittra</i>	
7.1 Introduction	213
7.2 Numerical analysis of multiple multi-scale objects using CBFM and IEDG	215
7.2.1 Introduction to CBFM and IEDG	215
7.2.2 MoM combined with CFIE	217
7.2.3 Elements of impedance matrix of MoM	219
7.3 Acceleration of electromagnetic analysis using CBFM	221
7.3.1 Partition of CBFM	221
7.3.2 Constructing CBFs by using multiple plane-wave excitation	222
7.3.3 Generation of reduced matrix equation in the CBFM	224
7.3.4 Multi-scale discretization using the IEDG method	226
7.3.5 Numerical results	230
7.3.6 Summary	234
7.4 Analysis of scattering from objects embedded in layered media using the CBFM	235
7.4.1 Introduction to CBFM analysis of the object embedded in layered media	235
7.4.2 Mixed potential integral equation for objects embedded in layered media	237
7.4.3 Numerical results	241
7.4.4 Summary	247
7.5 CBFM for microwave circuit and antenna problems	248
7.5.1 Introduction	248
7.5.2 SVD-based CBFM	248
7.5.3 Numerical results	251
7.5.4 Summary	254
7.6 Conclusions	254
Acknowledgment	254
List of acronyms	254
References	255
8 Statistical electromagnetics for antennas	259
<i>Hulusi Acikgoz, Ravi Kumar Arya, Joe Wiart, and Raj Mittra</i>	
8.1 Introduction	259
8.2 State of the art of variable antennas	262
8.3 Statistical methods	264
8.3.1 General approach and surrogate modeling	264
8.3.2 MC simulations	266
8.3.3 Polynomial chaos expansion	267
8.4 Case studies	271

8.4.1	Case I: Split ring resonator	271
8.4.2	Case II: Wearable textile antenna	278
8.5	Conclusions	282
	References	282
9	Ultra-wideband arrays	287
	<i>Markus H. Novak and John L. Volakis</i>	
9.1	Review of current UWB capabilities	288
9.1.1	Tapered slot	289
9.1.2	Fragmented aperture	290
9.1.3	Connected and coupled arrays	291
9.1.4	Material loading	293
9.2	Basic model of a UWB TCDA and feed	295
9.2.1	Modeling infinite coupled arrays	295
9.2.2	Circuit model of the balun	297
9.3	Considerations for planar UWB arrays	301
9.3.1	Feed planarization	301
9.3.2	Material and process selection	302
9.3.3	Limitations of PCB processing	302
9.3.4	Surface waves	303
9.3.5	Cavity resonance	309
9.4	Planar UWB arrays for millimeter-waves	313
9.4.1	Development of a three-pin balun	313
9.4.2	Sample design for 5G frequencies	316
	References	319
10	Reflectarray antennas	323
	<i>Eduardo Carrasco and Jose A. Encinar</i>	
10.1	Introduction	323
10.2	Basic concepts on reflectarray antennas	324
10.3	Elementary cells in reflectarrays	325
10.4	Analysis and design of reflectarray antennas	334
10.4.1	Analysis and design of reflectarray elements	334
10.4.2	Design and analysis of reflectarray antenna	334
10.5	Broadband techniques in reflectarrays	335
10.6	Shaped and multi-beam reflectarrays	340
10.7	Dual-reflector configurations	342
10.8	Technological challenges	344
10.8.1	Deployable and inflatable reflectarrays	344
10.8.2	Reflectarrays and solar cells	345
10.8.3	3-D printed reflectarrays	346
10.8.4	Reflectarrays at terahertz and optical frequencies	347
10.8.5	Liquid crystal reflectarrays	349
10.8.6	Reflectarrays using graphene	349

10.9	Conclusions	351
	Acknowledgement	351
	References	351

11 Novel antenna concepts and developments for CubeSats 361

Yahya Rahmat-Samii, Vignesh Manohar, and Joshua M. Kovitz

11.1	Introduction	361
11.2	Existing standards for small satellites	363
11.3	Antenna requirements for CubeSats	364
11.3.1	Frequency	364
11.3.2	Antenna radiated power, gain, and radiation pattern	365
11.3.3	Antenna material	366
11.4	Representative current antenna concepts for CubeSats	366
11.5	Ka-band symmetric umbrella reflector antennas (up to 0.5 m)	367
11.5.1	Antenna configuration	369
11.5.2	Reflector surface characterization	370
11.5.3	Deployment strategy	370
11.6	Ka-band offset reflector antennas (up to 1 m and beyond)	371
11.6.1	Reflector design and feed development	373
11.6.2	Proposed deployment strategy	374
11.7	Reflectarray concept	376
11.7.1	Deployment and design	377
11.7.2	Flight model performance	378
11.8	Patch antennas integrated with solar panels	380
11.8.1	Transparent (supersolar) patch antennas	380
11.8.2	Nontransparent (subsolar) patch antennas	381
11.9	Conclusion	384
	Appendix A Characterization of umbrella reflectors	384
A.1	Mathematical representation of the gore surface	385
A.2	Finding the optimum feed location	385
A.3	Gain loss as a function of the number of gores	387
	Appendix B Mesh characterization for deployable reflectors	389
B.1	Simple wire grid model	389
B.2	Equivalent wire grid model for complex knits	390
	Acknowledgement	393
	References	393
