Contents

1 The power grid as part of a 100% renewable energy system **1**
Math H.J. Bollen and Antonio Moreno-Munoz

1.1 Introduction 1
1.2 Status and trends in the voluntary use of renewable energy 3
1.2.1 World's leading companies pledge to use 100% renewable 3
1.2.2 The islands leading towards 100% renewable 4
1.3 The 100% renewable energy system 4
1.4 Flexibility 7
1.5 The role of the electricity transport 10
1.6 The role of energy storage 11
1.7 Reliability in the 100% renewable energy system 14
1.7.1 The view of the electricity consumer 14
1.7.2 The view of the electricity producer 15
1.7.3 The view of the system operator 15
1.8 The transition stage: towards 100% renewable energy 18
1.9 Renewable energy integration issues 19
1.10 The prosumer role 21
1.11 Key technologies 23
References 26

2 International requirements for large integration of renewable energy sources **29**
A. Molina-García, A.D. Hansen, E. Muljadi, V. Gevorgian, J. Fortmann and E. Gómez-Lázaro

2.1 General overview 29
2.2 Ancillary services in RES: comparisons among different countries 32
2.2.1 Active power reserves and frequency control 36
2.2.2 Reactive power control/voltage control 37
2.3 RES under disturbances: fault ride-through capability 39
2.4 Renewable energy curtailment 44
2.5 Acknowledgements 49
References 49

3 Nowcasting and short-term wind forecasting for wind energy management **59**
Agustín Agüera-Pérez, José Carlos Palomares-Salas, Juan José González de la Rosa, José María Sierra-Fernández and Álvaro Jiménez-Montero

3.1 Wind forecasting in grid and market operations 59
3.1.1 Uncertainty in wind energy production 60
3.1.2 Effects of the wind forecasts uncertainty in the power system 61
3.1.3 Wind uncertainty in market operations 62
3.2 Wind power forecasting systems 64
3.2.1 Wind control centres 65
3.2.2 Description of wind power forecasting systems 66
3.2.3 Wind power forecasting system results: representation and validation 68
3.3 Physical approaches for wind forecasting 70
3.3.1 Numerical weather prediction 71
3.3.2 Physical approaches focused on wind forecasting 73
3.4 Statistical approaches for wind forecasting 74
3.5 Enhancing predictions with nowcasting 79
References 81

4 Solutions and active measures for wind power integration **87**
Argo Rosin, Imre Drovtar and Jako Kilter

4.1 Introduction 87
4.2 Energy policy 88
4.3 Technology overview and prospective changes in the power grid 89
4.3.1 Overview of wind power plant technologies 90
4.3.2 Impact of electric transportation and electric vehicles 95
4.3.3 Impact of consumers 97
4.4 Technical and economic impacts of large-scale wind integration 100
4.4.1 Technical challenges 100
4.4.2 Impacts on existing power plant economics and electricity market 103
4.4.3 System frequency regulation and increasing wind capacity impacts on regulating reserves 106
4.5 Measures to support large-scale wind integration 108
4.5.1 Aggregated thermal storages for balancing of power generation forecast errors 108
4.5.2 Pumped hydro energy storage for balancing of power generation forecast errors 115
4.5.3 Demand side management for providing balancing power 119
4.6 Conclusion 125
References 125

5 Grid integration of large-scale PV plants: dealing with power fluctuations **131**
Javier Marcos Álvarez, Íñigo de la Parra Laita, Luis Marroyo Palomo, Eduardo Lorenzo Pigueiras and Miguel García Solano

5.1 Introduction 131
5.2 The photovoltaic observatory 133
5.3 Irradiance and power output fluctuations in large PV plants 135
5.3.1 At a PV plant level 135
5.3.2 Power fluctuations at a PV plant group level 142
5.4 Simulating power fluctuations at PV plants 149
5.4.1 PV plant model 150
5.4.2 Model of a group of PV plants 152
5.5 Smoothing power output fluctuations by using energy storage systems 158
5.5.1 The worst fluctuation model 160
5.5.2 Conventional ramp-rate control 161
5.5.3 Power Ramp-Rate control based on the PV power plant model 163
References 169

6 Towards the extensive use of renewable energy resources: needs, conditions and enabling technologies **171**
Isabel M. Moreno-Garcia, Rafael Real-Calvo, Victor Pallares-Lopez, Miguel J. Gonzalez-Redondo and Isabel Santiago

6.1 Introduction 171
6.2 Measurement and assessment of the renewable generation 175
6.2.1 Use of a PV monitoring system on time in a grid-connected PV park 176
6.2.2 Temporal requirements in the measurement of parameters to control the power quality of the generated signal 181
6.3 The interconnection between renewable generation and the electricity grid 185
6.3.1 Temporary requirements for protections 186
6.3.2 The active management of the interconnection 189
6.3.3 Solutions for the interconnection with electrical grid: smart inverter 191
6.4 Wide-area network: data model with the IEC 61850 standard for smart grid 193
6.4.1 Integration of renewables in wide area networks 194
6.4.2 Detection of faults in cascade and fall of the network (blackout) 195
6.4.3 Data model with the IEC 61850 standard 196

6.4.4 IEC 61850 modelling for distributed energy resource applications 197
6.4.5 Stability with synchrophasors and synchronisation with PTP 197
6.4.6 Justification of the distributed synchronism through the IEEE 1588 v2 protocol 199
6.5 Conclusions 202
References 204

7 DC distribution systems and microgrids 211
Tomislav Dragicevic, Amjad Anvari-Moghaddam, Juan C. Vasquez and Josep M. Guerrero

7.1 Introduction 211
7.2 DC microgrid system overview 211
7.2.1 Single-bus topologies 212
7.2.2 Multi-bus topologies 214
7.2.3 Reconfigurable topologies 216
7.2.4 Hybrid AC/DC MGs 218
7.3 Operation and control of DC microgrids 219
7.3.1 Local control functionalities 219
7.3.2 Coordinated control 223
7.4 DC microgrid system protection 226
7.4.1 Types of faults 226
7.4.2 Grounding 228
7.4.3 Protective devices 230
7.4.4 Design of protection systems 232
7.5 Application of DC microgrids to future smart grids 233
7.5.1 High-efficiency households 234
7.5.2 Renewable energy parks 235
7.5.3 Hybrid ESS 235
7.5.4 EV fast charging stations 235
7.6 Conclusions 235
References 236

8 Distributed energy resources integration and demand response: the role of stochastic demand modelling 245
Emilio J. Palacios-García, Antonio Moreno-Muñoz, Isabel Santiago-Chiquero, José María Flores-Arias and Francisco J. Bellido-Outeiriño

8.1 Introduction 245
8.2 Overview of modelling techniques for energy demand prediction 246
8.2.1 Top-down models 246
8.2.2 Bottom-up models 247
8.2.3 Comparison 248

8.3 Time of use based bottom-up models 249
8.3.1 Occupancy and consumers' behaviour 249
8.3.2 Lighting system consumption 253
8.3.3 General appliances consumption 257
8.3.4 Heating and cooling consumption 260
8.3.5 Remarks on the model 265
8.4 Applications of bottom-up stochastic models 266
8.4.1 Demand prediction 266
8.4.2 Energy policies and demand response strategies assessment 268
8.4.3 Distributed resources integration 271
8.5 Conclusion 275
References 276

9 Distributed micro-storage systems at residential level in smart communities with high penetration of photovoltaic generation 279
María Isabel Milanés-Montero, Fermín Barrero-González, Eva González-Romera and Enrique Romero-Cadaval

9.1 Overview of micro-storage technologies 280
9.1.1 Conventional batteries 282
9.1.2 Flow batteries 284
9.1.3 Supercapacitors 285
9.1.4 Superconducting magnetic energy storage 285
9.1.5 Flywheels 285
9.1.6 Comparison of characteristics of micro-storage system technologies 286
9.2 Topologies for the bi-directional electronic converter 288
9.2.1 Standard topologies 288
9.2.2 Multi-level topologies 291
9.2.3 Multi-port topologies 292
9.3 Control strategies for the ESMS of the storage device 294
9.3.1 Active power control strategies 295
9.3.2 Reactive power control strategies 296
9.3.3 Power quality and imbalance reduction control strategies 298
9.4 Power interfaces 300
9.4.1 Analysis of typical solution 301
9.4.2 An improved solution based on cooperative converters 304
9.5 Conclusions 306
