Preface	ix
1 Wide-area monitoring and analysis systems	1
1.1 Introduction	1
1.2 Wide-area monitoring systems: a conceptual overview	2
1.3 Data collection and management	3
1.4 Challenges of future smart monitoring and analysis systems	4
References	5
2 Wide-area monitoring system architectures	9
2.1 Introduction	9
2.2 WAMS architectures	9
2.2.1 Centralized WAMS architectures	11
2.2.2 Hierarchical WAMS architectures	12
2.2.3 Hybrid WAMS architectures	13
2.3 Issues in data fusion	13
2.3.1 Data	13
2.3.2 Intelligent synchrophasor data fusion	14
2.3.3 Power system data fusion strategies	16
2.3.4 General framework for data assimilation	20
2.4 Relationship between multiblock and single-block models	22
References	23
3 Spatio-temporal modeling of power system dynamic processes	27
3.1 Introduction	27
3.2 Visualization of large space-time measurement data	28
3.3 Spatio-temporal modeling of multivariate processes	29
3.3.1 Empirical orthogonal function (EOF) analysis	29
3.3.2 SVD-based proper orthogonal decomposition	33
3.3.3 Departure from mean value	36
3.4 Spatio-temporal interpolation methods	37
3.4.1 Background	37
3.4.2 Similarity measures	38
3.4.3 Spatial structures	40
3.4.4 Derivation of weights	40
3.4.5 Practical issues	41

3.5	Dimensionality reduction	42
3.5.1	Proximity (similarity) measures	42
3.5.2	Nonlinear spectral dimensionality reduction	43
3.6	Motivational example	47
3.6.1	Small-signal response	48
3.6.2	Large system response	48
3.6.3	Statistical analysis	49
3.7	Sensor placement	51
3.7.1	Problem formulation	53
3.7.2	Constrained sensor placement	54
	References	58
4	Advanced data processing and feature extraction	63
4.1	Introduction	63
4.2	Power oscillation monitoring	64
4.3	Time-frequency representations	65
4.3.1	Hilbert–Huang analysis	65
4.3.2	Wavelet analysis	72
4.3.3	The Teager–Kaiser operator	75
4.3.4	Dynamic harmonic regression	76
4.4	Multivariate multiscale analysis	81
4.4.1	Multi-signal Prony analysis	82
4.4.2	Koopman analysis	83
4.5	Response under ambient stimulus	87
4.5.1	Formulation of the model	87
4.5.2	Modal response	89
4.5.3	Ensemble system response	90
4.6	Application to measured data	90
4.6.1	HHT analysis	92
4.6.2	Wavelet analysis	94
	References	96
5	Multisensor multitemporal data fusion	101
5.1	Introduction	101
5.2	Data fusion principles	101
5.3	Data pre-processing and transformation	104
5.3.1	Bandpass filtering and denoising	104
5.3.2	Local-level fusion	105
5.4	Feature extraction and feature selection	105
5.4.1	Feature extraction	105
5.4.2	Data compression	106
5.4.3	Individual scales	109
5.4.4	Filtering and multiscale monitoring	109
5.5	Multisensor fusion methodologies for system monitoring	111
5.5.1	Single-scale analysis	112
5.5.2	Nonlinear PCA using auto-associative neural networks	112

5.5.3	Multiblock POD (PCA) analysis	113
5.5.4	Nonlinear PCA	119
5.5.5	Blind source separation	119
5.6	Other approaches to multisensor data fusion	124
	References	128
6	Monitoring the status of the system	131
6.1	Introduction	131
6.2	Power system health monitoring	132
6.3	Disturbance and anomaly detection	132
6.4	Modal-based health monitoring methods	134
6.4.1	Filtering and data conditioning	134
6.4.2	Entropy and energy	138
6.4.3	Entropy-based detection of system changes	141
6.5	Wide-area inter-area oscillation monitoring	143
6.5.1	Case A	143
6.5.2	Case B	145
6.6	High-dimensional pattern recognition-based monitoring	146
6.6.1	Sparse diffusion implementation	146
6.6.2	Data clustering	148
6.6.3	Numerical example	148
6.6.4	Hybrid schemes	150
6.7	Voltage and reactive power monitoring	150
6.7.1	Measured data	150
6.7.2	Statistical approach to voltage monitoring	151
6.7.3	Complex POD/PCA analysis	155
	References	156
7	Near real-time analysis and monitoring	159
7.1	Introduction	159
7.2	Toward near real-time monitoring of system behavior	159
7.3	Data processing and conditioning	160
7.3.1	Wavelet denoising and filtering	160
7.3.2	EMD-based filtering	162
7.4	Damage detection from changes in system behavior	163
7.4.1	Event trigger	164
7.4.2	Event detection based on linear filtering	164
7.4.3	An illustration	166
7.5	Time-series approaches to detection of abnormal operation	166
7.5.1	Near real-time implementations	166
7.5.2	Near real-time implementation of the Hilbert transform	169
7.5.3	Local mean speed	173
7.6	Pattern recognition-based disturbance detection	176
7.7	Sliding window-based methods	177
7.7.1	Local HHT analysis	177

7.7.2	Numerical example	180
7.7.3	Sliding window-based Koopman mode analysis	181
7.8	Recursive processing methods	182
7.8.1	State-space model for linear regression	182
7.8.2	Adaptive tracking of system oscillatory modes	183
	References	188
8	Interpretation and visualization of wide-area PMU measurements	191
8.1	Introduction	191
8.2	Loss of generation oscillation event	191
8.2.1	Operational context	192
8.2.2	Recorded measurements	192
8.3	Analysis and visualization of recorded data	196
8.3.1	Mode shape characterization	196
8.3.2	Damping estimation	197
8.3.3	Instantaneous parameters	197
8.3.4	Multitemporal, multiscale analysis of measured data	205
8.3.5	Performance evaluation	209
8.4	Pattern recognition analysis	211
8.4.1	Diffusion map analysis	211
8.4.2	Comparison with other approaches	214
8.5	POD/BSS analysis	216
8.6	Validation of power system model	218
8.6.1	Small signal performance	218
8.6.2	Large system performance	218
8.7	Evaluation of control performance	221
	References	225
Appendix A	Physical meaning of proper orthogonal modes	227
Appendix B	Data for the five-machine test system	231
Appendix C	Masking techniques to improve empirical mode decomposition	235
