Preface	xiii
1 Power quality definitions	1
<i>Ramani Kannan and Jagabar Sathik Mohd. Ali</i>	
1.1 Introduction to various power quality indices	1
1.1.1 Why are we concerned about power quality?	1
1.1.2 Definition of power quality	2
1.2 Various conventional power quality indices	3
1.2.1 Harmonics and interharmonic	3
1.2.2 Voltage fluctuations and flicker	6
1.2.3 Voltage unbalance	7
1.2.4 Power frequency variations	8
1.2.5 Transients	9
1.2.6 Short duration voltage variations	11
1.3 International standards	15
1.3.1 The Institute of Electrical and Electronic Engineering (IEEE) Standards	15
1.3.2 American National Standards Institute (IEEE/ANSI)	16
1.3.3 British Standards (BS) with IEC Standards	17
1.3.4 International Electrotechnical Commission (IEC) Standards	19
1.4 Cost of poor power quality	20
1.4.1 Investment analysis to mitigate costs of power quality	21
1.4.2 Economic impact of power quality disturbances	24
1.4.3 Economic mechanisms for improving power quality levels	26
References	27
2 Frequency-domain power theory and metering of harmonic-pollution responsibility	29
<i>Murat Erhan Balci and Mehmet Hakan Hocaoglu</i>	
2.1 Introduction	29
2.2 Power resolutions for non-sinusoidal single-phase systems	30
2.2.1 Budeanu's power resolution	31
2.2.2 Fryze's power resolution	32
2.2.3 Shepherd and Zakikhani's power resolution	33

2.2.4	Sharon's power resolution	34
2.2.5	Kusters and Moore's power resolution	34
2.2.6	Czarnecki's power resolution	35
2.2.7	IEEE standard power resolution	37
2.2.8	Balci and Hocaoglu's power resolution	38
2.3	Power resolutions for non-sinusoidal and unbalanced three-phase systems	40
2.3.1	Vector apparent power and its resolution	40
2.3.2	Arithmetic apparent power	41
2.3.3	Buchholz's apparent power and its resolutions	41
2.3.4	IEEE standard apparent power and its resolution	50
2.4	Practical implementation of apparent powers and their power resolutions included in IEEE standard 1459 and DIN standard 40110	51
2.4.1	LabView blocks of developed power meter	51
2.4.2	Measurement results	54
2.5	Metering of harmonic-pollution responsibility	59
2.5.1	The indices based on active power direction method	59
2.5.2	The methods based on the harmonic analysis of the system	61
2.5.3	The current decomposition based indices	63
2.5.4	The methods based on the evaluation of the non-active powers	65
2.6	The statistical evaluation of the <i>HGI</i> , <i>NLI</i> and D_s harmonic source detection approaches for different load types under several supply voltage waveforms	67
2.7	Conclusions	71
	References	71
3	Passive harmonic filters	77
	<i>Chamberlin Stéphane Azebaze Mboving and Zbigniew Hanzelka</i>	
	Summary	77
3.1	Introduction	77
3.2	General concept of passive harmonic filters	77
3.3	Series passive filters	79
3.4	Shunt passive filters	83
3.4.1	Single-tuned filter	83
3.4.2	Double-tuned filter	92
3.4.3	Broad-band filters	92
3.5	Hybrid passive filter	119
3.6	Conclusion	127
	References	127

4 Active harmonic filters	131
<i>A.M. Sharaf, Foad H. Gandoman and Behnam Khaki</i>	
4.1 Introduction	131
4.2 Industrial load models and characteristics	132
4.2.1 Dynamic and quasi-static harmonics in modern electrical networks	132
4.2.2 Industrial nonlinear loads types and characteristics	133
4.3 Active power filter topologies and design considerations	134
4.3.1 Active power filters use in AC and DC–AC power systems	134
4.3.2 Active power filters—design issues and considerations	135
4.3.3 Active power filters—industrial applications	136
4.4 Active power filters configurations	137
4.4.1 Current source active power filters—CSC	137
4.4.2 Voltage source active power filters—VSC	138
4.4.3 Shunt-active power filters	139
4.4.4 Series-active power filters	140
4.4.5 Hybrid-active power filters	141
4.4.6 Modern/distributed-active power filter	142
4.5 Active power filters—APF control strategies	143
4.5.1 Overview of APF control techniques	143
4.5.2 Heuristic soft computing-based control methods	144
4.5.3 Industrial load harmonic mitigation using APF control techniques	145
4.6 Emerging APF—applications and typologies	148
4.7 Case studies: design and optimization of an industrial active power filter	151
4.7.1 Case study I: APF application and control strategies for hybrid AC–DC industrial loads	151
4.7.2 Case study II: hybrid-APFs for AC–DC system	157
4.8 Conclusions	157
References	159
 5 Shunt flexible a.c. transmission	 165
<i>Grazia Todeschini</i>	
5.1 Introduction	165
5.2 Overview of harmonic concerns for shunt FACT devices and chapter content	166
5.2.1 Resonance conditions	167
5.2.2 Frequency scans	169
5.3 Power system model	170
5.3.1 Power system components	171
5.3.2 Background voltage distortion	179
5.3.3 Conclusions on system model	180

5.4	Shunt FACT device model	181
5.4.1	Static VAR compensator (SVC)	181
5.4.2	Static synchronous compensator (SSC or STATCOM)	186
5.4.3	High-voltage dc (HVDC) transmission	190
5.4.4	Conclusions on shunt FACT device model	192
5.5	Harmonic studies	192
5.5.1	Harmonic-performance studies	193
5.5.2	Harmonicating studies	198
	References	201
6	Power-quality improvement using series FACTS	205
	<i>Salah Kamel and Francisco Jurado</i>	
6.1	Introduction	205
6.1.1	Electricity network and power-quality overview	205
6.1.2	Load-flow analysis	205
6.2	Power-quality improvement using FACTS devices	208
6.3	Proposed SSSC model	209
6.3.1	Case 1: PQ control	210
6.3.2	Case 2: P control	211
6.3.3	NR-RCIM load-flow method with developed SSSC model	212
6.4	Proposed IPFC model	215
6.4.1	Master line	216
6.4.2	Slave line	218
6.4.3	Incorporating of developed IPFC model in NR-RCIM load flow	220
6.5	Validation of developed series FACTS models	220
6.5.1	Proposed SSSC model in NR-RCIM	220
6.5.2	Developed IPFC model in NR-RCIM	229
6.6	Conclusions	235
	References	235
7	Distributed generation systems	239
	<i>Khaled H. Ahmed and Ahmed A. Aboushady</i>	
7.1	Introduction	239
7.2	Distributed generation	241
7.2.1	Description of the problem	242
7.2.2	Applications of distribution generation	243
7.3	Voltage source converters	245
7.4	Control techniques in DG systems	247
7.4.1	Grid connection	247
7.4.2	Islanded mode	250
7.5	Power quality in DG	257
7.5.1	Grid connected	257
7.5.2	Island mode	258

7.6	Harmonics and passive filter design for DG	260
7.6.1	Power filter configurations	260
7.6.2	Analysis of the three filter topologies	261
7.6.3	Filter design	266
7.6.4	Case study	270
7.6.5	Damping filter design	270
7.6.6	Simulation results	272
	References	274
8	Backward–forward sweep-based islanding scenario generation algorithm for defensive splitting of radial distribution systems	283
	<i>F. Jabari and B. Mohammadi-Ivatloo</i>	
8.1	Introduction	283
8.2	Problem formulation	285
8.2.1	Proposed backward–forward-sweep-based islanding scenario generation algorithm	285
8.2.2	Objective function and constraints	288
8.2.3	Binary imperialistic-competitive-algorithm-based optimization process	288
8.3	Simulation studies	291
8.4	Conclusion	298
	Appendix	300
	References	301
9	Decentralised voltage control in smart grids	305
	<i>Amin Mohammadpour Shotorbani, Behnam Mohammadi-ivatloo, Liwei Wang and Saeid Ghassem Zadeh</i>	
9.1	Introduction	305
9.1.1	Voltage profile as power quality index	306
9.1.2	Microgrids	308
9.1.3	Motivation of cooperative decentralised control in smart grid	310
9.2	Decentralised and distributed control systems	311
9.2.1	Contraction-based multi-agent systems	313
9.2.2	Contract net interaction protocol	315
9.3	Centralised hierarchical control of the DERs	317
9.3.1	Frequency regulation	317
9.3.2	Voltage magnitude regulation	318
9.4	DER integration concealment	320
9.5	Reactive power dispatch	322
9.5.1	Power-flow equations	323
9.5.2	Sensitivity calculations	324
9.5.3	Modal analysis	325

9.6	Distributed voltage control schemes	326
9.6.1	Optimisation based on the Lagrange multipliers method	326
9.6.2	Distributed voltage control via multi-agent system	327
9.6.3	Distributed voltage control with simplified model-based sensitivity calculation	330
9.6.4	Decentralised cooperative optimisation using self-organised sensor network	333
9.6.5	Distributed cooperative gradient-descent optimisation of reactive power dispatch	336
	References	339
	Further Readings	341

10 Techno-economic issues of power quality **343**

Jayesh Joglekar

10.1	Introduction	343
10.2	Different approaches for finding out power quality impact on tariff	344
10.3	Design of modules to associate disturbance and economic loss	344
10.3.1	Case study 1: cement plant	345
10.3.2	Case study 2: industry	346
10.3.3	Case study 3: hospital	347
10.4	The relationship between duration of disturbance and its cost–benefit analysis index	348
10.5	Improvement of power quality in the system and its expected benefits	349
10.6	Power-quality investment and gross domestic product in developing countries: case study	350
10.6.1	Case 1: Nepal	350
10.6.2	Case 2: Sri Lanka	354
10.7	Conclusions	356
	Acknowledgment	356
	References	356

11 An economic robust programing approach for the design of energy management systems **359**

Felipe Valencia Arroyave and Alejandro Marquez Ruiz

11.1	Introduction	359
11.2	Robust programing framework	362
11.3	Energy management system as a robust programing problem	363
11.4	Case study and simulation results	370
11.5	Concluding remarks	376
	Acknowledgment	377
	References	377
