1	Spa	Spatial modulation for cooperative networks			
	1.1	Introduction	1		
	1.2	Protocol I: DSM	5		
		1.2.1 Transmission model	5		
		1.2.2 Demodulation at the destination	9		
		1.2.3 Error probability and diversity order analysis	12		
		1.2.4 Average energy consumption and average rate of DSM	16		
	1.3	Protocol II: DSM-STBC	20		
		1.3.1 Transmission model	20		
		1.3.2 Demodulation at the destination	24		
		1.3.3 Remarks	26		
		Numerical and simulation results	26		
		Conclusion	31		
		nowledgements	32		
	Refe	erences	33		
2	Rela	aying for massive MIMO	33 <b>39</b>		
	2.1	Introduction	39		
		2.1.1 Single-hop massive MIMO systems	42		
		2.1.2 Dual-hop massive MIMO systems	43		
	2.2	System configurations	44		
		2.2.1 Antenna configuration	45		
		2.2.2 Acquisition of channel state information			
		and duplexing modes	46		
		2.2.3 Transmission frame structure	48		
	2.3	Favourable propagation in massive MIMO	50		
		2.3.1 Channel modelling	51 53		
		Channel estimation			
	2.5	Massive MIMO configurations and signal processing aspects	54		
		2.5.1 General end-to-end signal model	54		
		2.5.2 Signal processing aspects	55		
	2.6	Fundamental performance metrics	57		

	2.7	Case study			
		2.7.1	Transmit power scaling at user nodes	59	
		2.7.2	Transmit power scaling at relay nodes	62	
		2.7.3	Transmit power scaling at user and relay nodes	63	
		2.7.4	Numerical results	65	
		2.7.5	System design insights	66	
	2.8	Summ	nary	67	
	Ref	erences	5	67	
3	SUI	DAS: n	nmWave relaying for 5G outdoor-to-indoor		
			cations	71	
			luction	71	
	3.2		ommunication systems	72	
			Massive MIMO	73	
			Small cells and mmWaves	73	
			Combinations of massive MIMO and mmWave	75	
			SUDAS – overview	75	
			SUDAS – working principle	76	
			SUDAS – application scenarios	78	
			Comparisons with VMIMO	80	
	3.3		AC – implementation	81	
			Amplify-and-forward	82	
			Compress-and-forward	83	
	3.4		ematical system model	84	
			SUDAS downlink communication model	84	
			System throughput	86	
	3.5		erical results	87	
			Average system throughput versus transmit power	87	
			Average system throughput versus number of SUDACs	88	
	3.6		AS – challenges	89	
			Keyhole effect	89	
			Carrier aggregation	90	
			Resource allocation for multiple MNOs	90	
			Mobility	91	
			Synchronization and channel estimation	92	
			Power consumption	92	
			lusions	93	
			dgements	93	
	Ref	erences	5	93	
4	Linear processing techniques for multi-antenna relaying systems with interference 9				
	systems with interference				
	4.1		luction	97	
			Interference mitigation in relaying systems	97	
		4.1.2	Interference exploitation for wireless-powered relaying	<i>a</i> -	
			systems	99	
		4.1.3	Organization of the chapter	100	

	4.2	Linear processing techniques	101
		4.2.1 Maximum ratio combining	101
		4.2.2 Zero-forcing	102
		4.2.3 Minimum mean square error	102
	4.3	Linear processing for interference suppression in relaying systems	103
		4.3.1 MRC/MRT scheme	104
		4.3.2 ZF/MRT scheme	106
		4.3.3 MMSE/MRT scheme	108
		4.3.4 Large N analysis	110
		4.3.5 Comparison of the schemes	110
		4.3.6 Numerical results	111
	4.4	Linear processing for interference exploitation in wireless-	
		powered relaying systems	113
		4.4.1 MRC/MRT scheme	115
		4.4.2 ZF/MRT scheme	118
		4.4.3 MMSE/MRT scheme	119
		4.4.4 Numerical results	121
	4.5	Conclusions	121
		4.5.1 Future directions	123
	Ref	erences	124
5	Rel	aying in full-duplex radio communication systems	129
	5.1	Introduction	129
		5.1.1 Duplex modes for relay systems	130
		5.1.2 Loopback self-interference	132
		5.1.3 Organization of the chapter	133
	5.2	System model	134
		5.2.1 End-to-end signal models	135
		5.2.2 Signal-to-interference-and-noise ratios	139
	5.3	Transmit power control in FD relaying	140
		5.3.1 AF relaying	142
		5.3.2 DF relaying	144
		5.3.3 Performance analysis	145
	5.4	FD vs. HD relaying	151
		5.4.1 Analysis of short-term performance	152
		5.4.2 Analysis of long-term performance	162
		Conclusions	170
	Ref	erences	170
6		ay selection in modern communication systems	175
		Introduction	175
	6.2	FD relay selection	175
		6.2.1 System model	176
		6.2.2 Optimal relay selection	177
		6.2.3 Max-min relay selection	178
		6.2.4 Loop interference relay selection	179
		6.2.5 Partial relay selection	179

		6.2.6	Max-min with loop interference relay selection	180		
			Optimal relay selection with hybrid relaying	181		
			Numerical results	182		
	6.3	Buffe	r-aided relay selection	184		
			System model	185		
		6.3.2	Max-min relay selection	187		
		6.3.3	Max-max relay selection (bound)	188		
		6.3.4	Max-link relay selection	188		
		6.3.5	Numerical results	194		
	6.4	Wirel	ess powered relay selection with wireless battery charging	197		
			System model	198		
			Random relay selection	200		
			Relay selection based on the closest distance	201		
		6.4.4	Distributed beamforming	202		
		6.4.5	Numerical results	203		
		Conc		205		
	Refe	erences	3	205		
7	Rela	aying i	n green communication systems	207		
	7.1	Introd	luction	207		
	7.2	Motiv	vation	208		
	7.3	Syste	m model and description	209		
			Basic system model	209		
			Metrics for energy evaluation	210		
		7.3.3	Definition of optimization problems	212		
			Power consumption model	214		
	7.4		parison of EE of relay protocols for three-node scenario	217		
			Relaying protocols	217		
			Optimization and comparison of ECR minimization	219		
			Study of special cases	224		
			Numerical results	227		
			Conclusion	230		
		-	y efficiency analysis of relay cooperation	231 239		
		7.6 Conclusions				
		Acknowledgements				
	Ref	erences	3	239		
8		0.	ficient relaying	243		
	8.1		luction	243		
			Energy efficiency	243

	8.2		y-efficient relay protocol design	245		
			Power control and relay design in three-way relay channels	246		
	8.3		y-efficient power allocation with AF relaying	249		
			Centralized power allocation	251		
		8.3.2	Distributed power allocation	254		

	8.4	Energy-efficient resource allocation with multiple-antenna	
		AF relaying	256
		8.4.1 Relay interference neutralization	256
		8.4.2 Receive filters allocation	259
		8.4.3 Centralized power allocation	260
		8.4.4 Distributed power allocation	263
	8.5	Multi-stream MIMO AF system	264
	8.6	Numerical results	266
	8.7	Conclusions	270
	Ref	erences	270
9	Cog	nitive relaying for information and energy cooperation	273
	9.1	Introduction	273
		9.1.1 Wireless challenges and motivation	273
		9.1.2 Literature review	274
		9.1.3 Organization of the chapter	277
		Network model	278
	9.3	Information cooperation	280
		9.3.1 Problem formulation	280
		9.3.2 Special structure of relaying matrix and reformulation	280
		9.3.3 An efficient algorithm and distributed implementation	282
	9.4	Information and energy cooperation	288
		9.4.1 System setting	288
		9.4.2 The ideal primary-cognitive cooperation	289
		9.4.3 A practical power-splitting cooperation	291
	9.5	Performance evaluation	294
		9.5.1 Benchmark and proposed schemes	295
		9.5.2 Outage performance due to the information cooperation	295
		9.5.3 Improved rate region	296
		9.5.4 Average SU rate	296
		9.5.5 Outage performance due to the additional energy	
		cooperation	298
		Concluding remarks and future directions	299
		endix A: Proof of Theorem 9.1	299
		endix B: Proof of Proposition 9.1	300
		endix C: Closed-form solution to Problem (9.60)	300
